

Developer Knowledge-Readiness Prep

Demo: Monday 8 June 2026 · 25 min demo + 20 min Q&A

This document is the **knowledge prep** for the developer attending the Yanmar deep-dive demo on Monday 8 June 2026. It is NOT the operational deployment checklist (see *demo-script-8-june.md* for that). What follows is what you need to have **in your head** if Sami pulls you in to answer a question, demo a feature ad-hoc, or talk architecture with Yanmar IT.

A — Yanmar-specific context (must-know)

People + roles

- **Shah Ally** — Sponsor. Senior. Will ask about budget, sourcing, sign-off discipline, ROI.
- **Dhruv Saxena** — PMO Lead. Will ask about methodology rigor, governance discipline, template fit.
- **Aiden Vendor** — External consultant Yanmar uses. Their budget is a separate cost-line.
- **Yanmar IT** — security team. Will ask about data sovereignty, GDPR, encryption, key management.

The 4 templates — 1:1 ready

For every template you must be able to **point at any element** and say “this comes from `X.field`”:

- **Action Tracker** → `Task` model + `Task.category` for sub-totals (COUNTIFS-style)
- **Project Plan** → `Project` + `ProjectMembership` (6 roles) + `Milestone` + `scope_in/scope_out` + `impact/solution`
- **Highlight Report** → `HighlightReport` model (4-axis RAG: Budget/Planning/Resources/Overall) + `Risk` (5x5 map) + `ProjectBudget` (Internal/External/ETC/Variance)
- **Meeting Minutes** → AI-generated DOCX from `MeetingTranscript` model

Yanmar pain points (what this is all for)

- **Manual copy-work** between templates — 15-20 hours/month lost
- **Delayed cost visibility** — waits on month-end for Actuals
- **External spend (Aiden)** invisible until invoice arrives
- **Governance discipline** — due dates slip without approval

B — Architecture (whiteboard-ready)

For IT questions you must be able to **draw this without script**:

Question	Quick handle
Other methodology?	Methodology-aware export selector. <code>CompanyExportPreference.default_template</code> + per-export ?
How long to prod-ready?	4-6 wk Option A · 10 wk Option B. See <code>aws-topology-yanmar.md</code> .
SAP integration?	Phase 2 SOW. 15-25 dev-days + Yanmar IT side. Read-sync first.
AI down?	Graceful 503. Non-AI features keep running. AI is feature-layer, not dependency.
Don't want AI?	BYO key off → no LLM calls. <code>ProjeXtPal</code> stays fully functional.
What does this cost?	DO NOT name until scope is locked. Back to Pricing discussion after internal review.
When can we start?	Contract signed = 1 week setup, 4-6 wk to prod. Staging from wk 2.
How do you test?	Per-feature regression, cross-tenant audit, data-guardian pre-deploy. DPIA \$5.
Contact?	Sami primary + product owner. Engineering 24h SLA.

E — Yanmar IT / security (not in script — anticipate)

Question	Answer
Where does our data live?	Option A: Frankfurt AWS-region in Inclufy multi-tenant. Option B: dedicated VPC with KMS-CMK
Who has access to our API keys?	Nobody — Fernet-encrypted at rest, key only in <code>FIELD_ENCRYPTION_KEYS</code> env. DBA with rea
How do you rotate keys?	<code>python manage.py rotate_field_encryption_keys</code> — MultiFernet supports overlap rotation (old key
GDPR right to erasure?	<code>GDPRDataExportRequest</code> + <code>GDPRDeletionRequest</code> models + signed export endpoint. 30-day SL
Sub-processors?	Anthropic (AI), Stripe (billing), Resend (email), Cloudflare (CDN/tunnel), AWS (infra). All EU-regio
ISO 27001 / SOC2?	In progress. Not certified today. Yanmar's requirements map 1:1 onto SOC2 controls.
Penetration test?	Last internal test end May 2026. P0 findings closed, P1 in sprint. External pen-test planned Q3 2
Data residency claim?	Postgres + S3 buckets in eu-central-1 (Frankfurt). Backups same. No US-hops in normal runtime

F — Recently shipped (be honest but selective)

DO mention (shows velocity)

- Dual-audience comments — reporters see friendly updates, admin/superadmin get full dev-context separately
- AI-triage classification with `escalate` for dev-only issues
- 4-tier pricing with Business layer between Pro and Enterprise

DO NOT mention (too early or irrelevant for Yanmar)

- `DEBUG=False` fix from today (sounds like sloppiness)
- Anthropic key rotation pending (sounds like security lapse)
- The 21 commits of June 1-2 around pricing/triage (too much detail)

G — What NOT to do / avoid

- **Do not** name specific pricing for Yanmar — Sami handles pricing separately.

- **Do not** name other clients unless asked. **Recare** is OK (live Inclufy customer), Zanjabil too (in-house). Do not name non-Inclufy clients.
- **Do not** go too deep into code during the demo. If they ask 'can we see the code?' → 'absolutely, after the demo in a separate session.'
- **Do not** promise what we can't deliver — especially do not promise SAP phase-2 for week X.
- **Do not** say 'we have that too!' if we haven't tested it — better 'that's on the roadmap, X-Y wk of work.'

H — Mental models ready

1. Train → Apply (Academy + ProjeXtPal flywheel)

Learner → Academy course → Inclufy cert → unlocked as methodology owner in ProjeXtPal → can lead PRINCE2/Agile/etc projects. Yanmar PMOs see this as a valuable onboarding path for new PMs.

2. Documents-from-data (inverted PMO discipline)

PMO discipline = 'the document must be right'. We invert that: data is right → document is deterministically generated → no drift possible. This is exactly why Yanmar's PRJ LEGO template (47 cells each sourced from Excel) is such a nightmare today.

3. BYO Key (procurement angle)

Not 'Inclufy has AI' — but 'Inclufy is a thin app-layer, you can plug your own AI-stack into it'. Sells to InfoSec. Sells to procurement (no vendor lock-in).

I — Three things you MUST be able to demo ad-hoc

If Dhruv asks 'can you show this live now':

- **1.** Add a Task → revise due-date 1x → revise 2x → push-back queue appears
- **2.** Open a Project → click 'Closing' → canvas pad → sign → sign-off recorded
- **3.** Settings → API Keys → toggle Anthropic to Custom → paste (dummy) key → save → toast appears + key masked in admin

Rehearse these 3 at least once dry before Monday.

TL;DR — Monday morning prep (1 hour)

Time	Do
0:00 - 0:15	Read demo script end-to-end (docs/yanmar/demo-script-8-june.md)
0:15 - 0:30	Scan DPIA + AWS topology doc (Q&A ammunition)
0:30 - 0:45	Dry-run the 3 demo actions (push-back, e-sig, BYO key toggle)
0:45 - 1:00	Read the 9 Q&A's and the 8 IT-questions out loud
